Official Meeting Minutes

System Demonstration & Sprint Review

Group Members: Galarza César, Gualotuña Brayan, Erazo Isaac

NRC: 30716

Date of Meeting: July 15, 2026

Project: Advanced Web System for "Ser salud" Comprehensive Clinic

Customer: Flores Villalva David Alejandro

"What is important is not being able, what is important is trying"

1. Meeting Metadata

Attribute	Details
Meeting Type	System Demonstration & Development Sync
Duration	36 Minutes (Recorded Session)
Customer Representative	Flores Villalva David Alejandro (Customer) & Edison (Stakeholder references)
Scrum Team Attendees	Galarza César, Gualotuña Brayan, Erazo Isaac
Objective	To review administrative dashboard functionalities, validate database migrations required by stakeholders, present calendar interface mockups, and discuss production deployment strategies.

2. Executive Summary

The meeting centered on validating the latest functional increments of the "Ser salud" system. The development team successfully demonstrated the new administrative dashboard, user role management (including specific views for doctors), and therapy management modules. Technical discussions highlighted recent database migrations and HTTPS configurations requested by stakeholders, as well as the implementation of caching to improve frontend performance. A major UI/UX update was approved: replacing standard list-based booking with a visual calendar that respects patient confidentiality while giving doctors full visibility. Finally, the team agreed on a cost-effective deployment strategy using free-tier services like Vercel and Render for the initial user load, avoiding unnecessary AWS expenses. The customer expressed high satisfaction with the progress and requested a final feature regarding inter-specialist session reports.

3. Detailed Discussion & Updates

3.1 Administrative Dashboard & Role Management

The team presented the finalized administrative summary view. This interface now provides an aggregated overview of recent appointments across all registered doctors. A significant update is the "User Management" module, which allows administrators to assign specific roles, notably the "Medical Profile". This role enables doctors to access a dedicated portal where they can manage their own assigned appointments, separating the administrative tasks from the clinical schedule management.

3.2 Therapy Configuration Module

The "Therapy Management" section was reviewed. Administrators can now dynamically control the catalog of active therapies visible to patients. This includes full CRUD

(Create, Read, Update, Delete) operations for therapy prices, descriptions, specialities, and associated imagery. This flexibility ensures the clinic can update its service offerings without requiring developer intervention.

3.3 Visual Calendar Implementation & Confidentiality

A major point of discussion was the transition from a standard form-based scheduling system to a visual, interactive calendar.

- **Patient View:** Patients will see a calendar where unavailable times are simply blocked out in red. No personal data of other patients will be visible, strictly maintaining medical confidentiality.
- **Doctor View:** Specialists will see a detailed calendar displaying their assigned appointments, including patient names and the specific therapies scheduled.
- **Inter-Specialist Referrals:** Doctors will also have the capability to view availability across other departments to facilitate internal patient referrals.

3.4 Technical Debt & Database Migrations

The backend team reported having to restructure several database tables and handle data migration due to late requirements from a stakeholder (Edison), specifically regarding backend language standardization and authentication methods. The team also successfully implemented HTTPS configurations and data caching, which the customer noted significantly improved the visual loading times (described as "top").

3.5 Deployment Strategy & Infrastructure Costs

The team discussed the production environment strategy. Given the projected initial load of 30-40 patients, deploying on paid virtual machines (like AWS EC2) was deemed unnecessary and financially inefficient. The agreed-upon architecture will leverage free-tier hosting services such as Vercel for the frontend and Render for the backend. The only immediate infrastructure cost will be the domain registration (approximately \$10-\$12 annually). The team also agreed to merge the currently separated backend repositories into a unified deployment once the current sprint concludes to optimize resource consumption.

3.6 Customer Feedback & New Feature Request

The customer expressed that the current state of the application exceeded expectations. As a final request for the upcoming delivery, the customer asked for an enhancement to the medical records system: When a doctor views a patient's profile, they should be able to read the observation reports from the patient's most recent sessions, even if those sessions were conducted by a different specialist within the clinic. The team confirmed that the foundation for this exists and will implement the required view.

4. Action Items & Next Steps

#	Action Item Description	Assigned To
1	Implement the visual Calendar UI for both Patient (confidential view) and Doctor (detailed view) portals.	UI/UX & Frontend Team
2	Develop the "Inter-specialist Observation Report" feature allowing doctors to read past session notes.	Backend Team
3	Merge the separated backend repositories into a unified architecture to optimize free-tier hosting limits.	Lead Developer
4	Prepare the final production deployment pipeline using Vercel (Front) and Render (Back), and configure the custom domain.	DevOps / Scrum Master
5	Finalize system polish and prepare the comprehensive presentation for the final academic exam.	Entire Team
