CLASS:

AWD - 30716

HOMEWORK:

OAuth

OAuth

- ❖ OAuth (Open Authorization) is a safe way to let one app connect to another app for you, without ever sharing your private passwords.
- ❖ It lets different apps work together easily so you don't have to create new accounts everywhere.
- ❖ It is the perfect mix of making your life easier while keeping your data safe.

How it Works

- ❖ Instead of giving out your password, OAuth gives the app a special digital key called an access token.
- ❖ This token is very strict and never gives an app full control over your stuff.
- ❖ It tells the app exactly what specific data it can see, what it is allowed to do with it, and when the key stops working (expires).

Real-World Examples

- ❖ You use OAuth all the time when you see buttons like "Log in with Facebook".
- ❖ It is also what lets a budgeting app look at your bank account transactions without the app ever knowing your actual bank password.
